Product Strategy & User Research Deliverable

PART 1: EMPATHY MAP

| TARGET PERSONA | PRIMARY GOAL | CORE CONFLICT |
|---|---|---|
| **Alex, 28 (Working Professional)** | **Consistent, Adaptive Strength Training** | **Busy Schedule vs. Rigid Plans** |

## Empathy Map Canvas

### 1. SAYS (VERBATIM QUOTES)

- "I don't have hours to manually research and plan workouts every week."
- "Personal trainers are way too expensive to hire long-term."
- "I feel like I'm hitting a plateau on my main compound lifts."
- "Is this plan actually suited for my fatigue and current progress?"

### 2. THINKS (BELIEFS & DOUBTS)

- Am I overtraining or undertraining this week?
- I wonder if my exercise selection is optimal or risking injury.
- Generic fitness apps provide static, boring templates that don't adapt.
- I need an intelligent tool that recalibrates when work runs late.

### 3. DOES (OBSERVED ACTIONS)

- Switches between 3–4 fitness apps and YouTube videos every few weeks.
- Logs reps and weights intermittently in standard phone notes.
- Skips full gym sessions when constrained by time instead of doing shorter splits.
- Tracks main lifts manually without visualizing progressive overload trends.

### 4. FEELS (EMOTIONAL STATES)

- **Frustrated:** By stagnant muscle growth and strength plateaus.
- **Overwhelmed:** By conflicting fitness advice across social media.
- **Guilty:** When busy work days force missed gym sessions.
- **Motivated:** When seeing clear visual progression and objective metrics.

## Pains & Gains Analysis

### Pains & Friction Points

- Lack of real-time workout adaptations based on actual fatigue.
- Time-consuming manual tracking across spreadsheets and notebooks.
- Inability to spot overtraining before burnout or minor injuries occur.

### Desired Gains & Value

- Automated workout adjustments based on time, fatigue, and equipment.
- AI coaching providing proactive, data-driven progressive overload.
- Clean visual analytics highlighting tangible physical milestones.

Product Strategy & User Research Deliverable

PART 2: PROBLEM DEFINITION

## Frame 1: Point of View (POV) Statement

### User POV Anchor

**User:** A busy working professional seeking consistent fitness results.
**Need:** A dynamic, highly personalized workout system that automatically adjusts to real-time progress, recovery levels, and unexpected schedule disruptions.
**Insight:** Traditional static fitness applications fail because daily life is unpredictable; rigid plans lead to missed workouts, plateauing, overtraining, and eventual abandonment.

## Frame 2: "How Might We" (HMW) Matrix

| FOCUS AREA | HOW MIGHT WE (HMW) STATEMENT | STRATEGIC OBJECTIVE |
|---|---|---|
| **1. Schedule Flexibility** | How might we enable users to instantly adjust workout length and exercise split when unexpected daily schedule changes occur? | Remove attendance friction and eliminate workout skipping. |
| **2. Dynamic Coaching** | How might we continuously analyze fatigue and performance data to auto-adjust set/rep targets before plateaus occur? | Maximize progressive overload safely without a human trainer. |
| **3. Habits & Retention** | How might we make logging effortless while surfacing encouraging, clear progression insights that sustain long-term engagement? | Drive long-term app habituation and positive feedback loops. |

## Frame 3: Core Problem Statement

### DEFINITIVE PRODUCT PROBLEM STATEMENT

"Users need a frictionless, intelligent way to receive personalized and adaptive workout programming **BECAUSE** rigid, pre-made fitness routines fail to accommodate fluctuating daily schedules and fatigue levels, leading directly to training plateaus, burnout, and abandoned health goals."
